

The Power of Armis Centrix™

VIPR Pro – Prioritization and Remediation and Early Warning

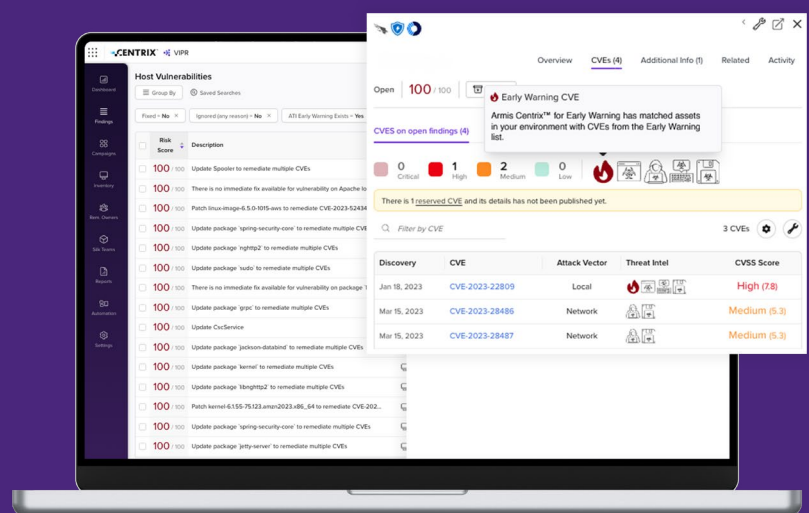

Security teams often struggle with a flood of security tool alerts and a growing list of Common Vulnerabilities and Exposures (CVEs). It has become exceedingly challenging to decide how to allocate limited resources toward mitigating the vulnerabilities that truly matter and represent risks to the assets that are most important to organizational operations.

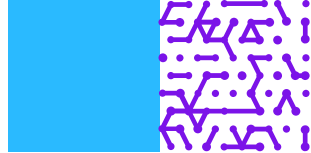

Traditional vulnerability management approaches, which often focus narrowly on CVEs with high technical severity but without necessary context, fall short in identifying what vulnerabilities need to be remediated to reduce the risk to an organization's crown jewels or critical assets based on the vulnerabilities that matter. Highlighting this discrepancy, [the top ten vulnerabilities targeted in 2023 were discovered before 2020](#), underscoring the inefficacy of current strategies in managing the attack surface and minimizing the window of exposure.

A new approach is required—one that **consolidates intelligence on vulnerabilities that matter most with internal context to prioritize critical findings and assets**. This involves integrating vulnerability visibility, asset contextualization and early warning threat intelligence to automate prioritization for urgent risks to the organization and streamlines the remediation lifecycle. This shift not only refines prioritization to reflect actual risk but also ensures timely and precise allocation of remediation efforts, transforming vulnerability management from a cycle of firefighting to a strategic initiative aimed at preempting attacks.

Advanced Prioritization To Close the Exposure Window

[Armis Centrix™ for VIPR Pro](#) integrated with [Armis Centrix™ for Early Warning](#) enables vulnerability management teams to move quickly and decisively to respond to the vulnerabilities that matter. Security teams benefit from a consolidated platform for proactive risk reduction - integrating early warning intelligence on risks from the vulnerabilities that matter, with internal context of which critical findings and assets to focus on. In combination, teams can focus limited resources on minimizing the exposure window for the vulnerabilities that matter and focus remediation efforts where business and exposure risk is the most urgent.

Why Armis Centrix™ is the Go-To Platform for Reducing Risk

AI-powered Cyber Exposure Management Platform

Visibility, protection and control of IT, OT, and IoT assets, managed and unmanaged, from the ground to the cloud.

Single Platform Delivery

Close the exposure window with a centralized, single system that consolidates various processes into one integrated platform, reducing complexities, blindspots, and inefficiencies while optimizing workflows.

Attacker-Focused, Early Warning Intelligence

Early warning, evidence-based insights that focus on attacker behaviors. This fills a current gap in intelligence feeds that utilize predictive insights and lack timely updates, helping organizations mitigate threats before they materialize.

Risk-Based Vulnerability Prioritization

Armis prioritizes remediation based on actual business impact, addressing the gap between vulnerabilities as well as security findings (ie: including assets, misconfigurations in code, cloud infrastructure, and application exposures) and actionable remediation.

AI-driven Asset Intelligence Engine

Armis monitors over 5 billion global assets, defining "normal" and pinpointing anomalies, including vulnerabilities on unconventional assets like medical devices and IoT.

Comprehensive Risk Reduction

Respond with certainty and close the exposure window for the vulnerabilities that matter by identifying and remediating critical impacted assets based on risk prioritization.

Centralize Remediation Management

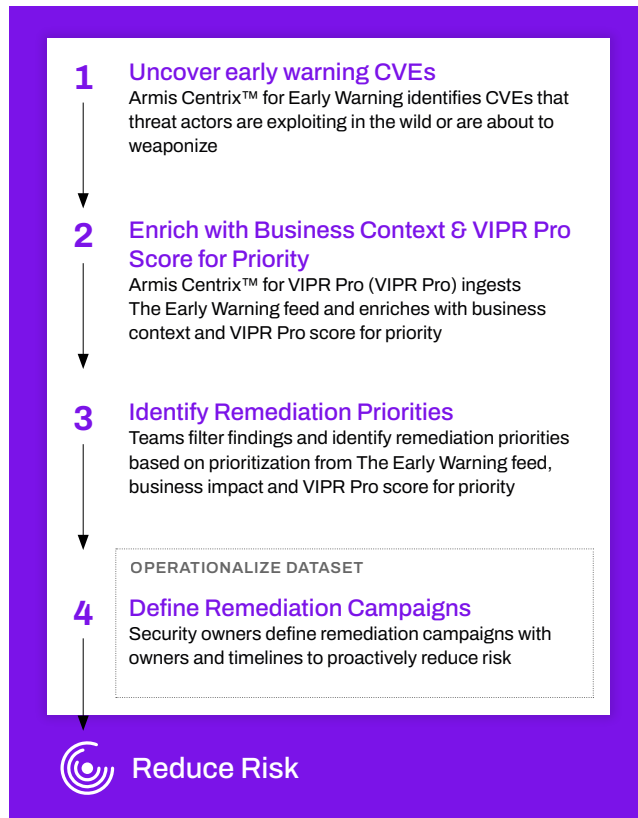

Automate ticketing, monitor activity and manage exceptions through bidirectional integrations.

Operationalize the Remediation Lifecycle

Centralize remediation management, automate ticketing, monitor activity and manage exceptions through bidirectional integrations with the existing security stack.

Operationalizing Risk Reduction

Why more businesses are trusting Armis to drive measurable outcomes

- Reduce vulnerabilities you need to worry about by up to 98%
- Translate millions of alerts to thousands of grouped findings
- 75% improved MTTR for the right findings to reduce risk
- 80% time savings by automating assessment
- 90% remediation task efficiency improvement through ownership assignment and ticket automation
- 7x increase the number of closed findings on an annualized basis
